

# TOO FEW VISITS TO THE DENTIST? The Impact on Children's Health

A Special Report from  
**Arkansas Advocates for Children & Families**

**February 2002**

# TOO FEW VISITS TO THE DENTIST?

## The Impact on Children's Health

### What Is Oral Health?

“Oral” is Latin for mouth – teeth, gum and supporting structures.

“Good oral health” is the absence of pain, disability and/or diseases in the mouth, face and its supporting structure.

Although dental disease is preventable, dental decay is still the most common and costly preventable oral health problem in all age groups. Poor oral health conditions originate in childhood and can worsen without proper care and treatment.

#### Why is Oral Health Important?

Research has shown the significance of oral health to physical and psychological health. Overall, oral disabilities affect one's quality of life.

- ✍ Oral disabilities hinder social interaction and can lead to stress and depression.
- ✍ Self esteem, the ability to eat and speak, facial appearance, and daily living free of dental discomfort all depend heavily on oral health.<sup>1</sup> Oral disorders can also affect breathing and swallowing.
- ✍ Left untreated, the pain and infection caused by dental decay can lead to problems in eating, speaking and learning.<sup>2</sup>
- ✍ Very young children with tooth decay weigh significantly less than their peers.<sup>3</sup> Chronically poor oral health is associated with diminished growth in toddlers,<sup>4</sup> compromised nutrition in children,<sup>5</sup> and cardiac and obstetric dysfunction in adults.<sup>6</sup>
- ✍ Almost 52 million school hours are missed annually by children because of oral problems.<sup>7</sup> Hence, oral disorders affect educational attainment.

#### How Big is the Problem?

Those with poor oral health are disproportionately low-income, and more likely to be a child or an elderly adult. Members of minority groups also experience a disproportionately high level

of oral health problems. Those with disabilities and complex health conditions are at greater risk for oral diseases that, in turn, further complicate their health.

Other statistics show:

- ✍ Children from low-income families have five times more untreated dental decay than children from high-income families.<sup>6</sup>
- ✍ Five to 10 percent of pre-school-aged children have decay. The rate is 20 percent for children in low-income families and 43 percent in some American Indian populations.<sup>8</sup> Decay is caused by frequent and prolonged exposure of the teeth to sugar and certain oral bacteria.
- ✍ More than a half of all children ages 6-8 and two-thirds of all 15-year-olds experience dental decay.<sup>9</sup>
- ✍ For more than a quarter of children, the trip to the emergency room is their first dental visit.<sup>10</sup>

#### What Role Does Prevention Play?

Prevention is a vital aspect of oral health. Most dental diseases in children are preventable. Teaching a child to practice good dental hygiene can prevent most childhood dental diseases. Education is an important component of preventive oral health care.

Many communities still do not realize that oral health is essential to physical, social and psychological well-being. Drinking fluoridated water and having dental sealants has been identified as the most potent weapon against cavities.

Oral health care should begin before birth. Babies' teeth are formed in the second trimester of pregnancy. At birth, all 20 primary teeth are already completely formed in the jaw. It is important for pregnant women to eat foods that contain calcium. Calcium makes babies teeth and bones strong.

## The Problem in Arkansas

Oral health in Arkansas is in a dire state. Arkansas was recently graded “D,” along with nine other states.<sup>12</sup> Forty other states were graded “C-” or above.

The cost of oral disease *prevention* is trivial compared to the cost of treating oral diseases. The average cost of sealing a tooth against decay is \$20. The average cost of one filling -- to repair a decayed tooth -- is \$66. These are affordable prevention measures. Arkansas can no longer use “poor and rural state” as an excuse to avoid addressing barriers to oral health.

Although oral health care is an integral part of overall health care, Arkansas children still face major obstacles in accessing oral health care. Problems faced by the general child population are:

- ✍ The number of uninsured children is increasing, especially in families with mid-level incomes. Most private health insurance plans have limited or no dental coverage and do not have oral health parity.
- ✍ Insured children with dental coverage still face an additional barrier – getting an appointment with the local dentist. This issue is more pronounced in the Medicaid population, since most dentists (64%) do not accept this type of insurance.

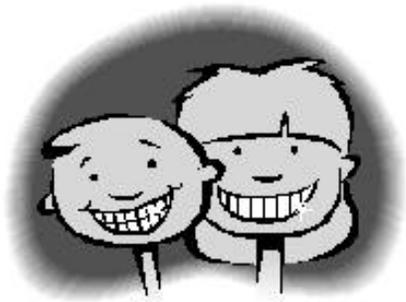

### Rural vs. Urban

The overall oral health system for children in Arkansas is in a state of emergency. The problems are more pronounced in rural areas. Although more than 46 percent of Arkansans live in rural areas, 54 percent of dentists are concentrated in seven metropolitan cities, where only 19 percent of Arkansans live:

- ✍ 252 dentists in Little Rock (Pulaski)
- ✍ 78 in Fayetteville/ Springdale (Washington)
- ✍ 72 in Fort Smith (Sebastian)
- ✍ 69 in Rogers/ Bentonville (Benton)
- ✍ 53 in Hot Springs (Garland)
- ✍ 41 in Jonesboro (Craighead)
- ✍ 33 in Pine Bluff (Jefferson)

Oral health problems range from lack of awareness about the importance of prevention and treatment to limited access to dental professionals and service.

- ✍ A shortage of dentists exists in the state. Dentists are concentrated in urban areas hence heightening the shortage in rural areas.
- ✍ Arkansas’ rural populations tend to be self-employed and are less likely to be able to afford health insurance, especially one with dental coverage, for their family.

### PREVENTIVE ORAL HEALTH

Clean your baby’s gums with a gauze pad to remove plaque and bacteria.

Take your child to the dentist by his 1st birthday, then visit the dentist at least annually.

Reduce exposure of your infant’s teeth to liquids containing sugar.

Begin brushing your child’s teeth with a little water when the first tooth appears.<sup>11</sup>

Brush teeth twice a day. Teach your children how to brush their teeth.

Drink fluoridated water.

Put dental sealants on your children’s permanent teeth as they come in.

Do not leave a bottle in your baby’s mouth while he sleeps.

Floss daily between teeth.

Other barriers are also linked to socio-economic status like inconvenient times for dental appointments, inability to pay out-of-pocket expenses, lack of transportation, and inability to take time off work. These barriers are experienced more by Arkansas' rural population.

Low-income Children

Research proves children living in low-income families fare woefully when seeking and accessing oral health. More than half -- over 400,000 Arkansas children -- live at or below 200 percent of poverty. All children living at or below this poverty level qualify for the state's Medicaid insurance program, but most dentists don't accept this type of insurance.

The state's Medicaid-mandated Early Periodic Screening Diagnosis Treatment program (EPSDT) is not making up for this gap either. Less than 1 percent of children eligible for EPSDT received dental care through the program in FY 2000. Dental expenditures constitute less than 2 percent of the medical expenditures of Arkansas' Medicaid program in the same period.

The other source of care for those with low incomes is Community Health Centers (CHCs). Currently, only six of the 42 CHCs in Arkansas have dentists on staff; the remaining 36 centers serve clients through a voucher system.<sup>13</sup>

Arkansas Statistics

Arkansas lags behind national averages in oral health measures. Two commonly used oral health indicators are sealant usage and decayed, missing or filled teeth (DMF).

- ✍ Only 17%<sup>14</sup> of Arkansas children have sealants on their teeth while the corresponding national rate is 23%.<sup>15</sup>
- ✍ Also, children in Arkansas have an average of 2.34 decayed, missing or filled teeth.<sup>16</sup> No national data is available.

**Oral Health Indicators**

	AR	US	Healthy People Goal
<b>Sealant Rate</b>	17%	23%	50%
<b>Dental Visits:</b> Population visiting the dentist during past year <sup>21</sup>	58.9%	67.9%	n/a
<b>Fluoridation Status:</b> Population receiving fluoridated public water <sup>22</sup>	58.7%	69%	75%
<b>Teeth Cleaning:</b> Population having teeth professionally cleaned during past year <sup>23</sup>	59.7%	62.1%	n/a
<b>Dentists per Person</b>	2,446	1,700	n/a

**DENTAL HEALTH & NUTRITION**

Plaque is a sticky film of oral bacteria that produces acids destroying the tooth's enamel, or hard outer surface. This process is called "demineralization."

Plaque is caused by the sugar and starch found in most foods, that is why it is important to brush your teeth after eating.

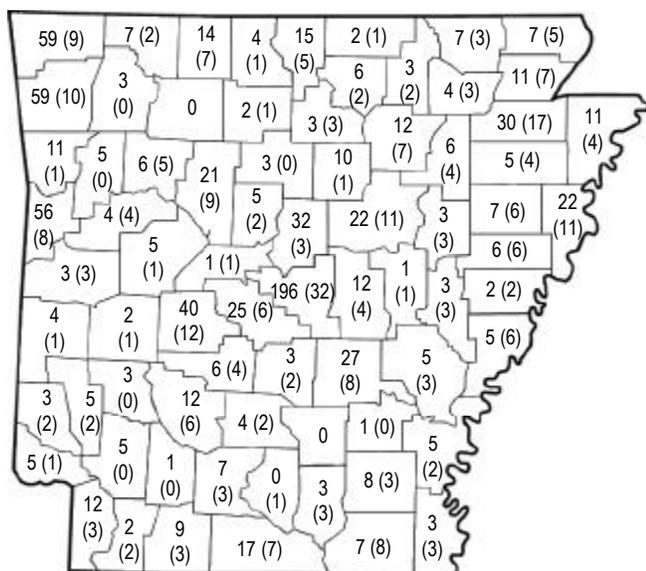

Limit the frequency and exposure of your baby's teeth to liquids containing sugar.

Eat a balanced diet.

Limit between-meal snacks.

Choose nutritious snacks, such as cheese, fruit and raw vegetables.

### Distribution of Dentists

# Number of Dentists Licensed w/in the County  
 (#) Number of Dentists Accepting Medicaid\*

\*These dentists receive at least \$1,000 a year in Medicaid reimbursements.

Although Arkansas' oral health indicators seem only slightly worse in comparison to national indicators, the true state of oral health in Arkansas is reflected in how these indicators compare to the goals of Healthy People 2010. Healthy People 2010 is a set of health objectives for the nation to achieve in the next 10 years. The initiative challenges individuals, communities and professionals to take specific steps to ensure that good health and long life are enjoyed by all. It is a project of the federal Department of Health and Human Services.

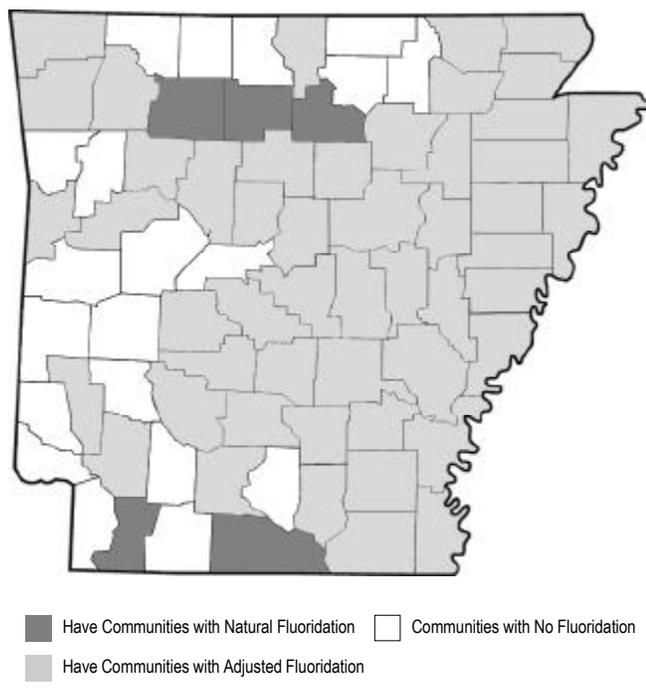

The indicators measure the state averages to rural and urban differences to show the prevalence of poor oral health in children. The significant inequity in rural-urban access to oral health care in Arkansas implies rural oral health indicators will be significantly worse off. And, as with any other health issue, children with disabilities are at even greater risk for having problems with oral health and access to care.

Currently, Arkansas has no state oral health plan, but the Arkansas Health Department Office of Oral Health is considering the development of one.

#### [Access](#)

In 2000, only 392 of the 1,110 Arkansas dentists billed for reimbursement from Medicaid. This suggests there were approximately 600 Medicaid children to each participating dentist. Current data does not indicate the actual number of children receiving care by these dentists or the number of times children visited these dentists.

### Communities with Fluoridated Water

Western Arkansas has more dentists than eastern Arkansas. However, a higher percentage of dentists in eastern Arkansas accept Medicaid patients compared to western Arkansas.

In Arkansas, 1,869 dental assistants and 855 dental hygienists are licensed to practice. Both groups of professionals have to perform nearly all their dental duties under the direct supervision of a dentist. Other states, like Connecticut, New Hampshire and New York, are resolving the problem of few dentists and/or lack of access to oral health care by widening the role dental hygienists<sup>24</sup> play in public health settings.

#### [Water Fluoridation](#)

Fluoride is a naturally-occurring element that prevents tooth decay. Fluoride can prevent tooth decay by two methods:

- ⚡ Systemically, when fluorides are ingested into the body during tooth formation; and
- ⚡ Topically, when fluorides such as toothpastes, mouth rinses and professional treatments are applied to the teeth.

Water fluoridation is the adjustment of the fluoride concentration in the water to the level recommended for the prevention of dental decay. The recommended level for Arkansas is 0.8 parts per million (ppm). Recommended fluoride concentrations vary by state, region and/or climate. Fluoride can occur naturally in water. In those

situations, water with more than 0.6 ppm of naturally-occurring fluoride is acceptable.

Community water fluoridation is the most economical way to deliver the benefit of fluoride to all residents of a community. It is an essential component of preventing tooth decay because it “remineralizes”<sup>20</sup> the teeth of people of all ages. Living in communities with a non-fluoridated water supply places residents at higher risk for tooth decay.

In Arkansas, a significant number of communities still do not have access to fluoridated water. The decision to fluoridate is made at the local level and some communities have elected not to fluoridate the water. Twelve percent of Arkansas’ water supply is from privately-owned wells. Usually, well-water cannot be fluoridated; but in cases where the well water can, the well owner determines whether or not to fluoridate.

Most of Arkansas’ un-fluoridated communities are in the western region. Fifty counties have at least one community with adjusted fluoridation level of between 0.6 to 1.2ppm. Five additional counties have natural fluoridation. Twenty counties have no communities with a fluoridated water source. Overall, only 58 percent of Arkansans live in communities with fluoridated water, compared to 62 percent nationally and a national goal of 75 percent.

## Solving the Problem in Arkansas

Oral health is vital to the psychological, physical and emotional well being of our children. Solutions do exist to Arkansas’ oral health emergency:

- ✍ Parents, dentists, communities and government agencies need to recognize the importance of oral health.
- ✍ More education needs to be available on the importance of good oral health care for parents and children.
- ✍ Oral health education should be incorporated into other existing preventive health programs, such as prenatal care and the federal Women, Infants and Children (WIC), a nutrition program for pregnant women.
- ✍ Communities should be aware of the benefits of fluoridated water.
- ✍ Arkansans should encourage their dentists to see more children with Medicaid insurance.
- ✍ Collaborations need to be formed with schools, communities, dentists and other needed parties to provide oral health care to children in the state.
- ✍ The state needs to carefully evaluate how to better utilize the services of other dental professionals to reach underserved children.
- ✍ The state needs to develop a strategic plan to increase the number of dentists in the state and their participation in the Medicaid insurance program.

### DENTAL SEALANTS

Plastic coatings applied to the biting surfaces of back teeth to seal out decay.

80% of tooth decay in children is on chewing surfaces of the teeth; use of dental sealants can prevent this kind of decay.<sup>17</sup>

Cost about \$20 per tooth. The cost of treating tooth decay far outweighs the cost of this preventive modality.

Can only be applied before cavities form in teeth. Sealants are of greatest benefit when applied to permanent teeth that erupt from age 6.

The Healthy People 2010 goal is to have at least a 50% sealant usage rate among children and adolescents. Currently, the national sealant usage rate is 23%; in Arkansas the rate is 17%.<sup>18</sup> Some populations in Arkansas have as low as 1.7% sealant usage rate.<sup>19</sup>

## MODEL PROGRAM

The Arkansas Department of Health Office of Oral Health and other individuals and organizations identified the need to engage parents in dialogues about their children's oral health.

This group performed dental screenings in 11 schools in the Little Rock School District. Schools were chosen because of their high percentage of low-income children, which are most like to be eating on the Free and Reduced Lunch program.<sup>25</sup>

The findings of the project have ignited discussion between parents, schools and the dentists. Most participating dentists are also providing follow-up care.

Programs like this help parents be more aware of the condition of their children's oral health and the importance of having children see the dentist. Such programs connect parents to dentists willing to provide their child with a dental home.
